106030012 廖昱瑋 工院 21 HW2

Part 1(linear):

(-)Code:

```
C hw2_linear.c > ♦ process_exit(void)
      #include <linux/init.h>
      #include <linux/kernel.h>
      #include <linux/module.h>
      #include <linux/sched/signal.h>
      #include <linux/sched.h>
      int process_init(void) {
          struct task struct *task;
          printk(KERN_INFO "loading module\n");
          for_each_process(task) {
              printk(KERN_INFO "pid: %d |pname: %s |state: %ld\n", task->pid, task->comm, task->state);
          return 0;
      void process_exit(void) {
          printk(KERN_INFO "removing module\n");
      module init(process init);
      module_exit(process_exit);
      MODULE_LICENSE("GPL");
      MODULE_DESCRIPTION("SIMPLE MODULE");
      MODULE_AUTHOR("廖昱瑋");
```

(二)說明:

使用 linux/sched.h 中的 struct task_struct,先宣告一個 task_struct 指標變數叫做 task,再搭配 linux/sced/signal.h 中的 for_each_process 函式, print 出 task->pid、task->comm、task->state。

(三)dmesg:

```

```

(二)說明:

宣告一個函數叫 dfs,裡面有一個型態為 task_struct pointer 的 argument,第一次先傳入 &init_task 給 dfs。在 dfs 裡先印出當前 task 的 pid、name 及 state,接著用 list_for_each loop 每個當前 task 的 child,list_for_each 裡面用 list_entry 抓出 child 並且用那個 child 當下一次 recursion dfs 的參數,這樣即可使用 dfs print 出所有的 tasks。

(三)demsg:
